
Nguyễn Đức Tùng

Senior .NET Developer

Dob: 15/10/2002
Gender: Male
Phone: 0896667391
Email: ndtung2018@gmail.com
Address: Xuan Vien Area, Kinh Bac Ward, Bac Ninh, Vietnam

OBJECTIVE

- Short-term goals (1–2 years): Develop in-depth knowledge of microservices architecture, cloud (Azure/AWS), and enhance system design skills as a Senior .NET Developer.
- Long-term goal (3–5 years): To become a Technical Lead, capable of leading a technical team and making software architecture decisions for the enterprise.

EDUCATION

4/2020 - 6/2024

Hanoi University of Economics and Industry

Information technology

Trained in core programming fundamentals including **.NET (C#)**, Front-end (HTML, CSS, JavaScript), Java, and Database management. Built a solid foundation in web application development and software engineering principles.

WORK EXPERIENCE

Oct 2025 - Present

SEOJIN VINA

Software Engineer

- Designed and developed desktop (**WinForms**) and web applications (**ASP.NET**) for the R&D Filter department
- Researched and delivered internal software solutions for the company and partners (e.g., **Nokia, SamSung, ...**)
- Improved quality of existing software systems currently in production use
- Analyzed data and generated reports to support decision-making across departments
- Communicated and responded directly with foreign clients in English, including reporting and presentations
- Mentored team members on adopting new technologies and guided staff on software usage to boost productivity
- Performed testing and debugging to ensure software stability and reliability

Jun 2024 - Aug 2025

CANON

Software Engineer

- Software design by **C#** (**Winforms**), Python in production
- Work with databases management systems (Oracle, SQL Server)
- Improve the quality of software in production
- Software testing and debugging
- Ability to respond to customers
- Make test and bugs reports in English
- Instruct employees on how to use software to increase productivity
- Analyze data for departments and companies

SKILLS

Programming	**C#**
Data Formats	**JSON**
Database	SQL Server, Oracle
Frameworks	ASP.NET, WinForms
Testing	**Test Planning & Design, Manual Testing, Fix bugs**
English	**Basic English Communication**
Codebase Proficiency	**Reading, utilizing & developing existing/unfamiliar codebases**
Problem Solving	Independent working, Alternative solution providing
Communication	Ability to communicate effectively and write clear reports to all technical and non-technical stakeholders

PROJECTS

Mar 2026 - Apr 2026

Nokia JSON Transfer System

Programming

- Independently designed and developed a desktop automation tool for Nokia calibration data processing in a manufacturing environment, replacing a fully manual workflow and reducing processing time by **~90%** — automatically converting Excel calibration files (3 required sheets) into **64 standardized JSON files per device** and packaging them into ZIP archives ready for production server upload
- Built a multi-server SFTP file management system supporting simultaneous connections to multiple production servers, with a full file explorer (cut/copy/paste, rename, delete, drag-and-drop) and parallel chunked file transfer engine **(4MB chunks, up to 4 concurrent connections)** for both local and remote file systems, powered by **SSH.NET and Parallel Processing (Task.WhenAll, Parallel.For)**
- Implemented an automated upload pipeline that dynamically replaces YYWW week codes, auto-creates remote directories, and pushes calibration packages to all connected servers in a single operation, with credentials and folder paths centrally managed via **SQL Server (ADO.NET)**
- Developed an interactive JSON metadata editor rendered via **WebBrowser control with COM Interop (JS ↔ C#)**, enabling technicians to review and patch calibration fields (vendorInfo, factoryInfo, timeStamp) before finalizing output, with native file icons and drag-and-drop via **Win32 P/Invoke (SHGetFileInfo, DragAcceptFiles)**
- Technology: **C#** (WinForms), Krypton UI Framework, SQL Server, SSH.NET, ExcelDataReader, **Newtonsoft.Json**, Win32 P/Invoke, Parallel Processing, COM Interop

Feb 2026 - Mar 2026

SFTP Server

Programming

- Independently designed and developed an internal SFTP Server management application that replaces commercial solutions such as FileZilla Server Pro, saving an estimated **$200–$500/year** in licensing costs while enabling secure SSH-encrypted file sharing across the factory LAN with a single click
- Automated the full OpenSSH Server (sshd) installation, sshd_config tuning, firewall port management, and per-user home directory permission setup via icacls, reducing manual SFTP setup time by **~90%** (from ~2 hours down to ~30 seconds), with full automatic rollback when the server stops
- Implemented a real-time account sync system polling SQL Server every second to automatically create or delete Windows local users when database records change, eliminating **~100%** of security risks caused by delayed removal of stale credentials
- Built an account management UI with inline DataGridView (create/update/delete/toggle active) connected directly to SQL Server, plus a real-time color-coded connection log monitor with log rotation handling
- Technology: **C#** (WinForms), Krypton UI Framework, SQL Server, Windows OpenSSH, PowerShell Automation, Win32 Process Invocation, System.Threading.Timer, NTFS icacls

Dec 2025 - Feb 2026

S Parameter Plot Viewer

Programming

- Independently designed and developed an internal RF signal analysis tool for electronics quality control (cables, connectors, PCBs, antennas) at Seojin Vina Factory 3, replacing commercial solutions such as MATLAB (~$2,000/year) and Keysight (~$3,000–$8,000/year), saving an estimated **$5,000–$10,000/year** in licensing costs
- Implemented parallel multi-threaded parsing to simultaneously load and visualize **20+ Touchstone files (.s2p, .s4p)**, reducing QC analysis time by **~60%** — from ~30 minutes down to ~8 minutes per batch — enabling earlier detection of RF component defects and reducing scrap/claim risk estimated at **$5,000–$50,000 per batch**
- Built a **Laser Line Intersection Mode** with automatic linear interpolation across all plotted series, allowing engineers to measure ΔFrequency and ΔMagnitude between any two points instantly, fully replacing manual calculation
- Developed a fully interactive chart engine with dynamic zoom (mouse wheel, rectangular selection, zoom history undo), left-click drag pan, click-to-annotate data points, series highlight, and real-time **GHz** ↔ **Hz** unit switching with automatic axis and data rescaling
- Technology: **C#** (WinForms), Krypton Ribbon, MS Chart (DataVisualization), Parallel Processing, SemaphoreSlim, System.Threading.Timer

Nov 2025 - Dec 2025

Warehouse Management System

Programming

- Developed a web-based warehouse management system using ASP.NET for tracking and controlling imported components via QR code — monitoring inventory status across the entire production process in real time, reducing processing time by **60%** and reducing component costs by **~25%** by eliminating over-ordering and inventory loss compared to the previous manual method.
- Technology: **ASP.NET,** SQL Server, QR Code Scanner, Real-time Search Interface

Oct 2025 - Nov 2025

Multiple Excel Pro

Programming

- Developed a desktop application for batch editing data across multiple Excel files and sheets simultaneously. Supports folder browsing, sheet selection via TreeView, random data generation, and parallel file writing with real-time preview and progress tracking
- Technology: **C#** (WinForms) EPPlus, Async/Await, Parallel Processing

Mar 2025 - May 2025

Trend Management Software

Programming

- Developed a PLC connection system using TCP/IP to collect cylinder data, analyze trends, and predict operating status — reducing machine downtime by **85%** and cutting cylinder replacement costs by **~35%** through predictive maintenance during production
- Technology: **C#** (WinForms), SQL Server, TCP/IP, PLC device, real time dashboard

Jun 2024 - Aug 2024

LPS Controlling Software

Programming

- Developed a desktop application using C# (WinForms) to manage imported components via QR code — tracking and controlling inventory status across the entire production process in real time, reducing quality inspection time by **40%** and cutting component procurement costs by **~20%** by preventing over-ordering and stock loss compared to the previous manual method
- Technology: **C#** (WinForms), SQL Server, QR code scanner, real time search interface
